**SITE INSPECTION REPORT
BLACK BUTTE MINE
COTTAGE GROVE, OREGON**

1. INTRODUCTION

Ecology and Environment, Inc. (E & E) was tasked by the to provide technical support for completion of a Site Inspection (SI) at the Black Butte Mine located near Cottage Grove, Oregon. E & E conducted the SI activities under Technical Direction Document No. 98-04-0004, issued under EPA Region 10, Superfund Technical Assessment and Response Team (START) Contract No. 68-W6-0008. The specific goals identified by EPA for the Black Butte Mine SI are:

- Document a threat or potential threat to public health or the environment posed by the site,
- Identify if a potential emergency situation exists that may require an immediate response,
- Assess the eligibility of the site for National Priorities List (NPL) inclusion, and
- Document the presence or absence of uncontained or uncontrolled hazardous substances on the site.

Activities conducted under this SI included reviewing previous information concerning the site, gathering new non-sampling environmental and geographic information, performing multi-media sampling at selected locations, and interviewing persons knowledgeable about past operations and ongoing site reclamation activities. Completion of the field investigation portion of the SI consisted of sampling activities performed at the mine and in nearby locations over a 5-day period in September 1998. The SI is intended to be an investigation of specific potential contaminant sources and environmental receptors, focusing on contaminants potentially existing at or released from the mine site. The SI is not intended to fully characterize the extent of potential contamination or to provide the basis for a quantitative assessment of human health or environmental risks posed by the site.

This document includes a discussion of site background information (Section 2), a discussion of SI field activities and analytical protocol (Section 3), a discussion of quality assurance/quality control (QA/QC) information (Section 4), a discussion of analytical results evaluation criteria and background sampling and analytical results (Section 5), a discussion of source sample locations and sample results (Section 6), a discussion of migration pathways and targets (Section 7), a summary of inspection findings and conclusions (Section 8), and a list of references (Section 9).

2. SITE BACKGROUND

This section describes the site location (Section 2.1), a description of previous site operations (Section 2.2), site ownership history (Section 2.3), and previous investigations at and near the site (Section 2.4).

2.1 SITE LOCATION

Site Name:	Black Butte Mine
CERCLIS ID No.:	OR0000515759
Location:	Cottage Grove, Oregon
Latitude:	43°34' 42" North
Longitude:	123°03' 58" West
Legal Description:	Township 23 South, Range 3 West, NW ¼ Section 6.
Site Owner/Contact:	Land and Timber Company 408 Commercial Street Coos Bay, Oregon 97420

The Black Butte Mine (BBM) is located in a rural area approximately 10 miles south of Cottage Grove, Oregon. The site is situated on the south slope of Black Butte which is part of the Calapooya Divide. Access to the site is via a dirt road east of London Road (Figure 2-1).

2.2 SITE DESCRIPTION

The BBM is a former mercury mine. The primary features at the site include tailings piles, a former mill structure containing a rotary kiln, several old dilapidated buildings, a system of unimproved roads, and partially caved-in mine adits (Figure 2-2). Much of the mine area was logged during the early 1990s, at which time several old mine structures were reportedly demolished. Access to the site is restricted by a locked gate; however, a dirt road leading onto the site from London Road crosses private property (b) (6) residence. Adjacent to the mine area is Dennis Creek, which flows westward to Garoutte Creek. Garoutte Creek flows northward to the Coast Fork of the Willamette River, which empties into Cottage Grove Reservoir (Figure 2-1).

2.3 SITE OWNERSHIP HISTORY

The original operator/owner of the mine was the Quicksilver Mining Company, which managed the operations until 1909 when the mine closed because of depressed mercury prices (Brooks 1971). The mine was re-opened in 1916 by a New York company under the management of Earl B. Crane (Brooks 1971). In 1927, the mine was purchased by the Quicksilver Syndicate (Brooks 1971). Mining operations continued until 1943 under this ownership, when mercury prices again forced closure of the mine (Brooks 1971). In 1956, the mine was again re-opened under lease to the Mercury and Chemical Corporation of New York (Brooks 1971). Information regarding the mine's subsequent ownership and operator are not documented in available literature. The current owner of the mine property is the Land and Timber Company of Coos Bay, Oregon (ODEQ 1996).

2.4 SITE OPERATIONS AND WASTE CHARACTERISTICS

The BBM was developed in the late 1890s. The BBM was the fourth largest mercury-producing mine in Oregon. Between 1900 and 1957, a total of 16,094 flasks of elemental mercury were produced at the mine (1 flask equals 76 pounds). Peak production occurred between the years 1927 to 1943. After 1943, the mine operated intermittently until its final abandonment in the late 1960s (ODEQ 1996).

Mercury-bearing ore (cinnabar) was extracted from underground mine tunnels and transported to the surface via light rail cars (Brooks 1971). Ore was crushed on site in one of three mills used at the site during its operational years. Within the mills, the crushed ore was heated in a rotary kiln where the elemental mercury was vaporized and subsequently condensed and captured for bottling (ODEQ 1996). Three mill sites are known to have existed at the Black Butte Mine (E & E 1998a). The location of the original mill is not known. The second mill, which reportedly operated from the early 1900s until the 1950s, reportedly was located south (uphill) of the tailings pile (b) (6) 1998. This mill site is currently heavily covered with brush and trees (E & E 1998a). START was unable to locate the remains of this mill during the SI fieldwork. The third mill, which operated from the 1950s until the mine's closure in the 1970s, is still present (b) (6) 1998. A rotary kiln, mercury condenser, and ore storage/crushing equipment are contained within the wooden mill structure (E & E 1998a; Figure 2-3).

Tailings from the ore milling operations were deposited north (downhill) of the mill observed during the SI toward Dennis Creek. The tailings form two "piles," essentially part of the same tailings deposit but separated by dense brush on the surface. The two "piles" include an "upper" pile and a "lower" pile: the "upper" pile is immediately below the mill site, while the "lower" pile has a north-facing side slope that angles steeply downward toward Dennis Creek. The toe of the "lower" tailings pile is approximately 30 feet from Dennis Creek (Figure 2-2; E & E 1998). The "piles" reportedly contain an estimated total of 300,000 cubic yards of tailings (ODEQ 1996).

One open mine adit exists at the site. The adit is located uphill (south) of the tailings piles and mill site on a steep slope at an elevation of approximately 1,600 feet above sea level. The adit, which is connected to the rest of the mine's underground workings, is filled with water which flows into a ditch and runs downhill into dense underbrush. The downstream discharge point for this water is unknown; a drainage from the adit through the tailings area was not located during the SI (E & E 1998).

2.5 SITE CHARACTERIZATION

This section discusses the previous investigations (Section 2.5.1) and the START site visit (Section 2.5.2).

2.5.1 Previous Investigations

In 1990 the Oregon State University (OSU) Department of Fisheries and Wildlife conducted a study to characterize the quality of sediments and aquatic biota tissues in three Oregon reservoirs, one of which was the Cottage Grove Reservoir, located approximately 6 miles downstream of BBM. Samples collected from within and near the Cottage Grove Reservoir included tissues from five large-mouth bass and ten sediment samples. Mercury was detected in fish tissue at concentrations of up to 1.79 parts per million (ppm) and in reservoir sediment samples at up to 1.11 micrograms per gram ($\mu\text{g/g}$; OSU 1991).

The United States Geological Survey (USGS) collected sediment samples near BBM in 1992 and 1993 as part of a periodic state-wide sampling program. Sample results indicated the presence of mercury in sediments collected from Dennis Creek at concentrations up to 2.5 ppm, in sediments collected from the Coast Fork of the Willamette River up to 1.4 ppm, and in sediments in Cottage Grove reservoir up to 0.50 ppm (USGS 1993).

OSU researchers conducted additional sampling at and near BBM in 1994. Sampling data indicated the presence of mercury in soils in the vicinity of the rotary kiln at concentrations up to approximately 350 mg/kg. Mercury was detected in Dennis and Garoutte Creek sediments downstream of BBM up to concentrations of 267 mg/kg, which supports the conclusion that elevated mercury concentrations can be traced to the Dennis Creek drainage, and may result from off-site transport of tailings from BBM.

In 1996 the Oregon Department of Environmental Quality (ODEQ) prepared a Preliminary Assessment (PA) of BBM under a cooperative agreement with EPA. The PA involved the collection and assessment of existing analytical and environmental information and an on-site reconnaissance of the mine. The PA report concluded that further evaluation of BBM under Comprehensive Environmental Response Compensation and Liability Act (CERCLA) was necessary to fully evaluate the threats posed

by on-site contaminants. On-site soil, surface water, and groundwater were identified as the pathways of most concern.

2.5.2 START Site Visit

Prior to visiting the BBM site, the START personnel met with ODEQ staff and collected additional background information regarding the site. During the site visit on May 28, 1998, the tailings piles were observed. Dennis Creek flows within 30 feet of the tailings for a linear distance of approximately 600 feet. Several old mine-related buildings were observed, although no hazardous substance sources were identified around these buildings. An on-site well was observed along the road to the adit location; the depth and construction details of the well are unknown. An open adit, previously identified by ODEQ staff, could not be accessed because of rough road conditions. Figure 2-2 illustrates the major site features observed during the site visit.

2.6 SUMMARY OF SI INVESTIGATION LOCATIONS

Based on review of background information and results of the site visit, three primary on-site features at the Black Butte Mine were identified for investigation under the SI as potential hazardous substance sources. Additionally, on- and off-site locations considered to be potential receptors of contamination that may migrate from the sources were identified for investigation. The sources and receptors investigated during the SI are outlined below.

Potential Sources include the following:

- **Mine Tailings.** An estimated 300,000 cubic yards of mine tailings have been deposited at the site. Previous sampling of creek sediments below the tailings suggests that the tailings are a source of elemental mercury.
- **Former Mill/Rotary Kiln.** Soils in the vicinity of the mill contain mercury up to concentrations of 350 mg/kg. The quantity of contaminated soil underlying the mill is unknown, but the mill covers an estimated area of approximately 1,800 square feet.
- **Mine Adit.** The open mine adit is filled with water that flows downhill toward Dennis Creek. The mine drainage may be acidic and is a possible source of heavy metals.

The migration pathway features include the following:

- **Groundwater.** Groundwater occurs in fractured bedrock in the site area, which may be in hydraulic connection with underground mine workings.

- **Dennis Creek.** Dennis Creek drains the BBM area. The "lower" tailings pile fronts approximately 600 feet of the creek, and mine tailings are located within 30 feet of the creek bed.
- **Garoutte Creek.** Dennis Creek flows into Garoutte Creek approximately 0.25 miles downstream of BBM. Garoutte Creek flows northward to a confluence with the Big River, forming the Coast Fork of the Willamette River. The Coast Fork of the Willamette River flows into Cottage Grove Reservoir.

The primary targets associated with site include the following:

- **Drinking Water Wells.** Approximately 64 domestic water wells are located within 4 miles of the site. The majority of these wells are located in the floodplain of Garoutte Creek and the Coast Fork of the Willamette River. In addition, at least one spring in the site vicinity is used for drinking purposes. The nearest well to the site is located approximately 0.5 miles from the mine tailings area of the site.
- **Wetlands.** Palustrine Forested and Palustrine Emergent wetlands exist along the Coast Fork of the Willamette River, starting approximately 1.9 miles downstream of the site. These wetlands front the river nearly continuously for approximately 4.7 miles to Cottage Grove Reservoir. Cottage Grove Reservoir is bordered by Palustrine Emergent wetlands in several locations, with wetland frontage of approximately 1.7 miles along the lake. No additional wetlands exist within the Target Distance Limit along the Coast Fork of the Willamette River downstream of Cottage Grove Reservoir.
- **Fisheries.** Sport fishing is conducted in Garoutte Creek, the Coast Fork of the Willamette River, and Cottage Grove Reservoir. Species harvested include Cutthroat trout and Bull trout (Dolly Varden). Garoutte Creek is a spawning and migration area for Cutthroat trout.
- **Threatened and Endangered Species.** One endangered species, two threatened species, and four species of concern are known to use terrestrial habitat in the site vicinity.

3. FIELD ACTIVITIES AND ANALYTICAL PROTOCOL

A sampling and quality assurance plan (SQAP) was developed for the Black Butte Mine SI prior to fieldwork (E & E 1998b). The SQAP describes the sampling strategy, sampling methodology, and analytical procedures to investigate potential hazardous substance sources at the mine and nearby targets. No deviations to the sampling methodologies presented in the SQAP were implemented during the SI with the exception of the type of equipment used to collect subsurface soil samples (Section 3.1.4).

The SI fieldwork was conducted between August 31 and September 3, 1998. A total of 52 samples were collected during the SI (excluding quality control samples). Specific descriptions of sample locations are provided in Sections 6 and 7. Table 3-1 summarizes the number, location, and analytical parameters for the sample collected during the SI. Photographic documentation of all sample locations is provided in Appendix A.

3.1 SAMPLING METHODOLOGY

Grass, leaves, rocks, and other debris unsuitable for analyses were removed from samples before being placed into sample containers. All solid matrix samples were thoroughly homogenized with clean dedicated stainless steel utensils prior to containerization. Samples were placed into prelabeled containers and preserved when appropriate. All samples were stored under E & E's custody in sealed coolers with ice until shipment.

3.1.1 Surface Water Samples

Eight surface water samples were collected from Dennis Creek, Garoutte Creek, and the mine adit. Samples were collected at downstream locations before moving to upstream locations in order to minimize introduction of suspended solids into the samples. For sample stations where collocated surface water/sediment samples were collected, the surface water sample was collected prior to the corresponding sediment sample. During collection of all surface water samples, care was taken to avoid introduction of sediment into the sample containers.

These samples were collected by hand-dipping the prelabeled 1-liter polyethylene sample containers directly into the water to a depth of approximately 2 inches below the water surface.

3.1.2 Sediment Samples

Eight sediment samples (including background samples) were collected from Dennis Creek, Garoutte Creek, and the mine adit. These samples were collected at depths ranging from 0 to 4 inches in depth below the sediment surface. The sample material was collected using clean, dedicated, plastic spoons, and was placed directly into clean, dedicated, plastic mixing bowls for homogenization. Following thorough homogenization, the sediment was transferred to prelabeled 8-ounce glass jars.

3.1.3 Groundwater Samples

Eleven groundwater samples (including a background sample) were collected from existing domestic wells and two springs in the site area. Groundwater samples were collected following a minimum purging time of 20 minutes and after water quality parameters (pH, conductivity, temperature) had stabilized within 10 percent of the previous reading.

The domestic well groundwater samples were collected by pumping the well water directly into the sample containers from a port as near the wellhead as possible. The spring groundwater samples were collected by hand dipping the prelabeled sample container approximately 2 inches below the spring water surface. During sampling, care was taken not to disturb any sediment on the bottom of the springs. Groundwater collected via a bailer from the on-site well was transferred directly to prelabeled sample containers. The on-site well was not purged prior to sample collection because of a down-hole obstruction and the quantity of water that would need to be removed from the 6-inch diameter well.

3.1.4 Soil Samples

Fourteen surface soil samples were collected from the mine tailings, the former mill/rotary kiln, and background locations. All samples were collected with clean, dedicated plastic spoons and transferred to a clean, dedicated plastic bowl for homogenization. Following thorough homogenization, the sample material was placed directly into prelabeled sample containers.

Eleven subsurface soil samples were collected from the mine tailings, the former mill/rotary kiln, and a background location. The subsurface soil samples were collected using two methods: a powered rotary auger and a combination of a hand shovel and stainless steel hand auger. The latter method was used for the collection of subsurface soil samples at the "lower" tailings because of refusal of the powered auger at shallow depths, and at the former mill/rotary kiln because of physical access limitations. Use of the hand shovel and stainless steel hand auger represents a modification to the subsurface soil sampling protocol in the SQAP that specified the use of the powered auger. Following retrieval of subsurface soil in the hand auger, the sample was collected with clean, dedicated plastic

spoons and transferred to a clean, dedicated plastic bowl for homogenization. Following thorough homogenization, the sample material was placed directly into prelabeled sample containers.

3.1.5 Quality Control Samples

Two QC rinsate samples were collected from non-dedicated sampling instruments used during the SI, including the hand shovel and the hand auger. The rinsate samples were collected following decontamination of each tool, using the same process used prior to sample collection. Deionized water was poured over and through each of the pieces of equipment and collected directly into prelabeled sample containers.

3.2 ANALYTICAL PROTOCOL

All samples collected during the SI were submitted for off-site laboratory analyses; no field analytical screening was conducted. Analytical methods applied to SI samples included EPA Target Analyte List (TAL) inorganic elements (23 elements; Method ILM 4.0).

The TAL inorganic analyses were performed at EPA's Region 10 Laboratory at Manchester, Washington, using EPA Contract Laboratory Program (CLP) protocols.

3.3 GLOBAL POSITIONING SYSTEM

A Trimble Pathfinder Professional global positioning system (GPS) was used in the field to survey SI sampling points and boundaries of major site features. However, at nearly every survey location, the GPS system was unable to provide reliable coordinates as a result of either poor satellite coverage, topography, or overhead obstructions (trees, dense underbrush). GPS data is therefore unavailable for the SI. Sample and feature locations indicated on the maps in this report were determined using ground-level measurements in the field, plotted on topographic maps and an aerial photograph.

3.4 INVESTIGATION-DERIVED WASTE MANAGEMENT

Investigation-derived waste (IDW) generated during the SI fieldwork consisted of the following:

- Decontamination fluids;
- Used dedicated sampling equipment; and
- Used disposable personal protective equipment.

Decontamination fluids were evaporated to the extent possible during the fieldwork. At the conclusion of the fieldwork, approximately 5 gallons of fluids remained. This waste was transported in a

55-gallon drum to E & E's Seattle warehouse and is pending disposal. Used personal protective equipment and dedicated sampling equipment was rinsed, placed in doubled plastic bags and disposed of in Seattle at a municipal landfill. No IDW from the SI field activities remains at the site.

4. QUALITY ASSURANCE/QUALITY CONTROL

Quality assurance/quality control (QA/QC) data are necessary to determine precision and accuracy and to demonstrate the absence of interferences and/or contamination of sampling equipment, glassware, and reagents. Specific QC requirements for laboratory analysis are incorporated in EPA's *CLP Statement of Work for Inorganic Analysis* (ILM04.0, EPA 1991). These QC requirements or equivalent requirements were followed for analytical work performed on the Black Butte Mine SI. This section describes the QA/QC measures taken for the SI and provides an evaluation of the usability of data presented in this report.

All samples were collected following the guidance of the SQAP (E & E 1998b) for the field activities. Inorganic element analyses were performed by EPA's Region 10 Laboratory following ILM04.0 (EPA 1991).

All data from analyses performed at the laboratory was reviewed and validated by EPA chemists. Data qualifiers were applied as necessary according to the following guidance document:

- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994).

Copies of the data validation memoranda are included in Appendix B.

4.1 SATISFACTION OF DATA QUALITY OBJECTIVES

The following EPA guidance document was used to establish data quality objectives (DQOs) for this SI:

- Data Quality Objectives Process for Superfund, Interim Final Guidance, September 1993).

The EPA determined that definitive data without error and bias determination criteria would be used for the sampling and analyses conducted during the field activities. The data quality achieved during the fieldwork was sufficient in producing data that could be used for the data objectives stated in the SQAP (E & E 1998b).

A detailed discussion of the SI objectives that were accomplished is presented in the following sections.

4.2 QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

QC samples included laboratory duplicate samples and matrix spike (MS) samples at a rate of one duplicate and MS per 20 samples per matrix.

The analytical laboratory also analyzed several QC samples for quality assurance purposes according to the methods, including initial and continuing calibrations, method blanks, matrix spikes, duplicates, and laboratory control samples.

4.3 PROJECT-SPECIFIC DATA QUALITY OBJECTIVES

The laboratory data were reviewed to ensure that the DQOs for the project were met. The following describes the abilities of the laboratories to meet the project DQOs for precision, accuracy, and completeness and the field team's ability to meet project DQOs for representativeness and comparability. The laboratories and the field team were able to meet DQOs for the project. See the attached quality assurance memoranda in Appendix B for qualifiers applied to data based on QC outliers.

4.3.1 Precision

Precision measures the reproducibility of the sampling and analytical methodology. Laboratory and field precision is defined as the relative percent difference (RPD) between duplicate sample analyses. The laboratory duplicate samples measure the precision of the analytical method. For this project, none of the results were qualified based on duplicate sample analysis results.

4.3.2 Accuracy

Accuracy measures the reproducibility of the sampling and analytical methodology. Laboratory accuracy is defined as the matrix spike percent recovery (%R). The matrix spike values were reviewed for all MS analyses. Approximately 6.0% of the data were qualified as estimated quantities ("J" or "UJ") based on MS recoveries. Approximately 2.7% of the data were rejected ("R") based on MS recoveries. Overall, the project DQOs outlined in the SQAP (E & E 1998b) for accuracy were met.

4.3.3 Completeness

Data completeness is defined as the percentage of usable data (usable data divided by the total possible data). All laboratory data were reviewed for data validation and usability. Approximately

97.3% of the data were determined to be usable, therefore, the project DQO for completeness of 90% was met.

4.3.4 Representativeness

Data representativeness expresses the degree to which sample data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or environmental condition. The number and selection of samples were determined in the field to account accurately for site variations and sample matrices. Based on this rationale, the DQOs for representativeness were met.

4.3.5 Comparability

Comparability is a qualitative parameter expressing the confidence with which one data set can be compared to another. Data produced for this site followed applicable field sampling techniques and specific analytical methodology outlined in the SQAP (E & E 1998b). The DQOs for comparability were met.

4.4 LABORATORY QUALITY ASSURANCE/QUALITY CONTROL PARAMETERS

The laboratory data also were reviewed for holding times, laboratory blank samples, rinsate blank samples, initial and continuing calibrations, and laboratory control samples. These QA/QC parameters are summarized below. In general, the laboratory and field QA/QC parameters were considered acceptable.

4.4.1 Holding Times

None of the sample results were qualified based on holding time outliers.

4.4.2 Laboratory Blanks

All laboratory blanks met the frequency criteria. Barium and antimony were detected in the laboratory blanks. Any associated sample results less than five times the blank contamination were qualified as not detected ("U"). Associated sample results were qualified as estimated quantities ("J") if the sample result was less than five times the absolute value of the negative blank concentration. See the data validation memoranda (Appendix B) for sample results that were qualified based on blank contamination.

4.4.3 Rinsate Blanks

All rinsate blanks met the frequency criteria. Chromium, manganese, nickel, arsenic, and lead were detected in both rinsate blanks. The nickel and chromium results in samples 98BBMT01SS and 98BBMT01SB were qualified as not detected ("U") based on rinsate blank results. No other sample qualifications were required based on the rinsate concentrations, indicating that the equipment decontamination procedures were acceptable.

4.4.4 Initial and Continuing Calibrations

All calibrations met the frequency criteria. No qualifications were applied based on calibration results.

4.4.5 Laboratory Control Samples

All laboratory control sample analyses met the frequency criteria. Approximately 2.7% of the sample results were qualified as estimated quantities ("J" or "UJ") based on laboratory control sample outliers.

5. ANALYTICAL RESULTS REPORTING AND BACKGROUND SAMPLES

This section describes the reporting criteria and reporting methods applied to analytical results presented in Sections 6 and 7 of this report. A discussion of background locations and sample results also is provided. A list of samples collected for laboratory analyses appears in Table 3-1.

5.1 ANALYTICAL RESULTS EVALUATION CRITERIA

Analytical results presented in the summary tables in Section 6 and 7 show all elements detected above laboratory detection limits in bold type. Analytical results indicating significant concentrations of contaminants in source samples (Section 6) with respect to background concentrations are shown underlined and in bold type. Similarly, analytical results indicating elevated concentrations of contaminants in target samples (Section 7) with respect to background concentrations also are underlined and in bold type. For the purposes of this investigation, significant or elevated concentrations are those concentrations that are:

- Equal to or greater than the sample's contract-required quantitation limit/contract required detection limit (CRQL/CRDL) or the sample quantitation limit (SQL) when a non-CLP laboratory is used; and
- Equal to or greater than the background soil sample's CRQL/CRDL or SQL when the background concentration is below detection limits; or
- At least three times greater than the background soil concentration when the background concentration equals or exceeds the detection limit.

The analytical summary tables present all detected compounds, but only those detected analytes at potential sources or in targets meeting the significant or elevated concentration criteria are discussed in the report text.

For analytical results that are qualified as estimated, the sample concentration was adjusted as described in *Using Qualified Data to Document an Observed Release and Observed Contamination* (EPA 1996) before determining whether the concentration is significant or elevated. For target locations, only those analytes that also were detected in a source at the site were evaluated to determine whether their concentrations were elevated. All hazardous substances detected at target locations and meeting evaluation criteria can be used to document an observed release from the site to the target. When

samples were diluted for re-analysis at the laboratory, the dilution results were considered for evaluation and are provided in the tables.

5.1.1 Sample Results Reporting

Based on EPA Region 10 policy, evaluation of aluminum, calcium, iron, magnesium, potassium, and sodium (common earth crust elements) generally is employed only in water mass tracing, which is beyond the scope of this report. For this reason, the presence and distribution of these elements are not discussed in this report. For source and target analytical results, only those concentrations meeting the significant/elevated concentration criteria are discussed. For background samples, all detected concentrations are discussed.

5.2 BACKGROUND SAMPLES

Background samples were collected for each of the media from which SI samples were collected. These media include surface soil, subsurface soil, groundwater, sediment, and surface water. Results for the appropriate background sample(s) appear as the first column in the analytical results summary tables in Sections 6 and 7 to facilitate comparison against source or target results.

5.2.1 Background Soil

This section discusses sample locations (Section 5.2.1.1) and sample results (Section 5.2.1.2).

5.2.1.1 Sample Locations

Two off-site background surface soil samples and one off-site background subsurface soil sample were collected. The surface soil background samples were collected in a forested area approximately 100 yards from London Road, approximately 0.5 miles west of the mine. Background surface soil sample 98BBBG01SS was collected from a depth of 0 to 6 inches and consisted of brown, sandy, rocky soil, consistent with the nature of the on-site mine tailings (surface) samples. Background surface soil sample 98BBBG02SS was collected from a depth of 0 to 6 inches, and consisted of brown, loamy, silty soil, consistent with the matrix of surface soil samples collected at the former mill/rotary kiln area on the site. The background subsurface soil sample was collected in a forested area approximately 0.5 mile west of the mine (same location as 98BBBG01SS) from a depth of 2 feet, consistent with the matrix of subsurface soil samples collected in the mine tailings and at the former mill/rotary kiln area.

5.2.1.2 Sample Results

Thirteen inorganic elements were detected in the background soil samples, ranging in concentration from 0.972 mg/kg (beryllium in sample 98BBBG01SS) to 3,520 mg/kg (manganese in sample 98BBBG02SS). The results of the background samples are included in Table 6-1 (98BBBG01SS and 98BBBG01SB), and Table 6-2 (98BBBG02SS and 98BBBG01SB). All of the background soil samples contained mercury at concentrations ranging from 5.48 mg/kg to 20.3 mg/kg. These concentrations likely result from naturally occurring, mercury-containing mineral deposits in the site area.

5.2.2 Background Groundwater

This section discusses the sample location (Section 5.2.2.1) and sample results (Section 5.2.2.2).

5.2.2.1 Sample Location

One background groundwater sample was collected from a private domestic well located approximately 1.5 miles north of the mine in the Combs Creek drainage (b) (6) well, 98BBDW09GW. This well is considered to be not hydraulically downgradient from the site. This sample was used to document background concentrations for the domestic well, springs, and mine adit water samples.

5.2.2.2 Sample Results

Six inorganic elements were detected in the background groundwater sample. The results of the sample are included in Table 7-2.

5.2.3 Background Sediment

This section discusses sample locations (Section 5.2.3.1) and sample results (Section 5.2.3.2).

5.2.3.1 Sample Locations

Two background sediment samples were collected for the SI. One sediment sample (98BBDC02SD) was collected from Dennis Creek approximately 0.5 mile upstream of the mine tailings to document background sediment concentrations applicable to Dennis Creek sediment samples and the Mine Adit sediment sample. One background sample (98BBGC02SD) was collected from Garoutte Creek approximately 600 feet upstream of the confluence with Dennis Creek to document background sediment concentrations for the sediment sample collected downstream of the confluence with Dennis Creek.

5.2.3.2 Sample Results

Twelve inorganic elements were detected in the two background sediment samples, ranging from 0.850 mg/kg (beryllium in sample 98BBDC05SD to 1,160 mg/kg (manganese in sample 98BBDC05SD). The results of the background sediment samples are included in Table 7-4.

5.2.4 Background Surface Water

This section discusses sample location (Section 5.2.4.1) and sample results (Section 5.2.4.2).

5.2.4.1 Sample Locations

Two background surface water samples were collected for the SI. One background surface water sample (98BBDC05SW) was collected from Dennis Creek approximately 0.5 mile upstream of the mine tailings to document background concentrations applicable to Dennis Creek surface water samples. One background surface water sample (98BBGC02SW) was collected from Garoutte Creek approximately 600 feet upstream of the confluence with Dennis Creek to document background concentrations for the surface water sample collected downstream of the confluence with Dennis Creek.

5.2.4.2 Sample Results

Up to four inorganic elements were detected in the background surface water samples, ranging in concentration from 2.1 $\mu\text{g}/\text{L}$ (arsenic in sample 98BBGC02SW) to 25 $\mu\text{g}/\text{L}$ (chromium in sample 98BBGC02SW). The results of the background surface water samples are included in Table 7-3.

6. POTENTIAL SOURCES

This section summarizes the physical characteristics of the potential hazardous substance sources, and describes the locations and analytical results of the samples obtained for the SI. Table 3-1 lists the sample identifications and locations for all samples collected for the SI. The E & E alphanumeric station identification codes are used to identify samples in this section. Laboratory data sheets containing analytical results for the SI samples are contained in Appendix B. Tables 6-1 through 6-4 summarize the results of the source samples collected for the SI.

6.1 SUMMARY OF SOURCE CHARACTERISTICS

Figure 2-2 illustrates the potential sources evaluated for the SI. A discussion of containment factors and source sizes is provided below.

- **Mine Tailings.** The mine tailings are relatively fine (sand to coarse sand in size) and are reddish in color. The quantity of tailings at the site has been previously estimated at 300,000 cubic yards. Interpretation of aerial photography indicates the tailings cover an area of approximately 400,000 square feet (9.2 acres). The tailings piles have no engineered cover or liner, and no run-off or run-on controls exist.
- **Former Mill/Rotary Kiln.** Soils surrounding, within, and underlying the Former Mill/Rotary Kiln represent a source of hazardous substances. The quantity of contaminated soil is unknown, however, the mill structure covers an estimated area of 1,800 square feet. The kiln may also be a source of hazardous substances as the inside of the kiln may be coated with mercury and heavy metals-containing dust. The quantity of hazardous substances associated with the kiln itself is unknown. No engineered run-on or run-off controls exist at the Former Mill/Rotary Kiln, and no liner is known to be present.
- **Mine Adit.** The open mine adit is filled with water which discharges onto the ground surface at an estimated rate of approximately 1 gallon per minute (as observed during the SI). No run-on or run-off controls exist at the mine adit.

6.2 SOURCE SAMPLE RESULTS

Analytical results of the water and soil/waste samples for each source are provided below. Source sample locations are illustrated in Figures 6-1 (Tailings Piles), 6-2 (Former Mill/Rotary Kiln), and 6-3 (Mine Adit).

- **Mine Tailings.** Six surface tailings and six subsurface tailings samples were collected from the Mine Tailings source. Sample locations were selected to provide a representative aerial coverage of both the "upper" and "lower" tailings piles. Sample results for the Mine Tailings are included in Table 6-1.

Inorganic elements detected at significant concentrations in the Mine Tailings samples include: arsenic (ranging from 239 to 382 mg/kg) and mercury (148 mg/kg). Only one of the mine tailings samples (98BBMT02SB), collected at the "upper" tailings pile, contained a significant concentration of mercury. Inorganic element concentrations in the surface tailings samples were similar to the concentrations detected in the subsurface tailings samples.
- **Former Mill/Rotary Kiln.** Six surface soil samples and four subsurface soil samples were collected from the Former Mill/Rotary Kiln. Sample locations were selected to characterize areas where mercury deposition was likely to have occurred during mill operations. Sample results for the Former Mill/Rotary Kiln are included in Table 6-2.

Inorganic elements detected at significant concentrations with respect to background in the Former Mill/Rotary Kiln samples include: arsenic (ranging from 114 mg/kg to 952 mg/kg), cadmium (ranging from 0.21 to 1.92 mg/kg), chromium (858 mg/kg), copper (535 mg/kg), lead (ranging from 31.1 to 57.5 mg/kg), mercury (ranging from 91.9 to 54,300 mg/kg), nickel (188 mg/kg), selenium (1.4 mg/kg JL) silver (0.54 mg/kg JL), vanadium (682 mg/kg), and zinc (ranging from 307 to 2,330 mg/kg). All of the samples collected at the former mill/rotary kiln contained significant concentrations of mercury. The highest concentrations of mercury were detected in surface soil samples collected outside of the mill structure.
- **Mine Adit.** One water sample and one sediment sample were collected from the Mine Adit to determine if hazardous substances are being released from underground workings of the mine. Sample results for the Mine Adit are included in Table 6-3(water) and Table 6-4 (sediment).

Inorganic elements detected at significant concentrations in the Mine Adit water sample include antimony (1.6 $\mu\text{g/L}$), chromium (18 $\mu\text{g/L}$), cobalt (11 $\mu\text{g/L}$), copper (13.5 $\mu\text{g/L}$), manganese (508 $\mu\text{g/L}$), and nickel (34 $\mu\text{g/L}$).

Inorganic elements detected at significant concentrations in the Mine Adit sediment sample include beryllium (10.8 mg/kg), cobalt (325 mg/kg), copper (967 mg/kg), lead (25.9 mg/kg), manganese (8,320 mg/kg), nickel (168 mg/kg), mercury (adjusted concentration of 11.5 mg/kg), and zinc (297 mg/kg).

7. MIGRATION PATHWAYS AND TARGETS

This section addresses the groundwater migration pathway and the overland flow/flood migration component of the surface water migration pathway. Included in this section are descriptions of the physical characteristics and targets associated with each migration pathway, and the analytical results of the samples collected to characterize each pathway. The air migration and soil exposure pathways were not evaluated for the SI.

7.1 GROUNDWATER MIGRATION PATHWAY

This section discusses pathway characteristics (Section 7.1.1), summarizes targets (Section 7.1.2), and provides groundwater sample results (Section 7.2.3).

7.1.1 Pathway Characteristics

The geology of the Black Butte area consists of andesitic lavas, tuffs, and breccias of the Calapooya Formation (Tertiary). These volcanic rocks have been injected by dikes and intrusive masses of basalt and andesite. Hydrothermal solutions rising along faults within the formation have created altered rock zones composed of carbonates and clay minerals. Cinnabar (mercury ore) occurs in faults along the altered bedrock zones (Brooks 1971).

In the mine area, reddish-brown clay and silty clay overlies the bedrock. The depth to bedrock varies according to slope steepness but generally ranges between 4 and 10 feet. In the flood plains of Garoutte Creek and the Coast Fork of the Willamette River, unconsolidated alluvial deposits of gravelly clays and silts form a relatively thicker horizon (greater than 30 feet) over bedrock (USDA 1987).

Based on a review of drilling logs of water wells, groundwater in the site vicinity occurs within the bedrock of the Calapooya Formation. The drilling logs indicate water wells near the site range in total depth between 35 and 120 feet below ground surface (bgs) and have yields ranging from 25 to 80 gallons per minute. Static water levels in domestic wells near the site range from 19 feet bgs to over 100 feet bgs. None of the logs reviewed indicated the presence of groundwater in unconsolidated alluvial deposits with sufficient yield for a water well within at least 1 mile of the site (OWRD various dates). Therefore, all wells within the site's target distance limit (TDL) are assumed to be completed in the same aquifer, which occurs in the bedrock underlying the alluvial deposits. The groundwater flow direction at and near the site is not documented. However, groundwater flow in the bedrock aquifer at the mine site

is assumed to be toward Dennis Creek. Flow direction in the Garoutte Creek floodplain (the location of most water wells near the site) is assumed to be northward towards Cottage Grove Reservoir, which is consistent with regional groundwater flow gradients (ODEQ 1996).

7.1.2 Summary of Targets

Figure 7-1 illustrates the target distance limit for the groundwater migration pathway.

Approximately 64 domestic water wells are located within 4 miles of the site (OWRD 1998). The majority of these wells are located in the floodplain of Garoutte Creek and the Coast Fork of the Willamette River. In addition, at least one spring in the site vicinity (within 0.25 mile) is used for drinking purposes (b) (6) spring; E & E 1998a). The nearest well to the site is located approximately 0.5 miles to the northwest from the mine tailings area of the site. The (b) (6) spring is located within 0.25 miles of the tailings area. The average number of persons per household for Lane County is 2.49, based on the 1990 census (USCB 1999). Table 7-1 summarizes the groundwater population for the site vicinity, based partly on the county household average population data and on survey information collected during the SI fieldwork.

No public groundwater supply systems exist within 4 miles of the site (OWRD 1998).

7.2.3 Groundwater Pathway Sample Results

Ten groundwater samples, including 8 wells and two springs, were collected from locations hydraulically downgradient of the mine (Figure 7-2). The background well is located 1 mile northeast of the site in the Big River valley. Sample results for the groundwater samples are included in Table 7-2.

Inorganic elements detected at elevated concentrations in the groundwater samples include arsenic in two wells, ranging from 93.9 $\mu\text{g/L}$ at the (b) (6) Well to 94.9 $\mu\text{g/L}$ at the (b) (6) well, chromium in two wells ranging from 28.2 $\mu\text{g/L}$ at the (b) (6) well to 30.2 $\mu\text{g/L}$ at the (b) (6) well, copper in three wells ranging from 3.8 $\mu\text{g/L}$ at the (b) (6) well to 14.2 $\mu\text{g/L}$ at the (b) (6) well, lead in two wells ranging from 3.69 at the on-site well to 4.55 $\mu\text{g/L}$ at the (b) (6) well, nickel in two wells ranging from 13 $\mu\text{g/L}$ at the (b) (6) well to 18 $\mu\text{g/L}$ at the (b) (6) well, and selenium two wells ranging from 1.6 $\mu\text{g/L}$ at the (b) (6) well to 3 $\mu\text{g/L}$ at the (b) (6) well.

The (b) (6) well, on-site spring, and the (b) (6) spring did not contain elevated concentrations of inorganic elements. Mercury was not detected at elevated concentrations in any of the groundwater samples. Arsenic was the only contaminant detected in groundwater that exceeded primary maximum contaminant levels (MCLs) for drinking water. The arsenic MCL was exceeded in three domestic wells (b) (6) and (b) (6).

7.2 SURFACE WATER MIGRATION PATHWAY

This section discusses pathway characteristics (Section 7.2.1), summarizes targets (Section 7.2.2), and provides surface water pathway results (Section 7.2.3).

7.2.1 Pathway Characteristics

Figure 7-3 illustrates the extent of the 15-mile surface water TDL for Black Butte Mine. Two primary probable points of entry (PPEs) for sources at the site to the surface water migration pathway were established in the Dennis Creek drainage. The PPEs include:

- A PPE associated with the mine tailings located at the northwest base of the "lower" tailings pile (PPE1). This PPE corresponds to sample location 98BBDC03SW/SD; and
- A PPE associated with an intermittent tributary entering Dennis Creek that may receive overland runoff from the Former Mill/Rotary Kiln and Mine Adit areas (PPE2). This PPE corresponds to sample location 98BBDC04SW/SD.

PPE2 is located approximately 1,500 feet east (upstream) of PPE1. From PPE1, Dennis Creek flows westward approximately 1,160 (0.22 miles) to the confluence of Dennis Creek and Garoutte Creek. The surface water TDL continues downstream from PPE1 and includes Dennis Creek below the mine to Garoutte Creek, Garoutte Creek to its confluence with Big River, the Coast Fork of the Willamette River to Cottage Grove Reservoir, Cottage Grove Reservoir, and a 2.4 mile section of the Coast Fork of the Willamette River downstream of Cottage Grove Reservoir.

Stream flow is not measured on Dennis Creek; however, its flow during the SI fieldwork was estimated at 0.25 cubic feet per second (CFS; E & E 1998). Stream flow data for Garoutte Creek is not available. Stream flow on the Coast Fork of the Willamette River near the town of London, approximately 4 miles downstream of Dennis Creek, had an average flow of 35.8 CFS between November 1986 and November 1987. Cottage Grove Reservoir is a dammed section of the Coast Fork of the Willamette River, and therefore is considered a slow moving river for the purposes of this report. Stream flow on the Coast Fork of the Willamette River below the Cottage Grove Reservoir Dam had an average flow of 53.4 CFS between September 1996 and September 1997 (OWRD 1998).

The Black Butte Mine receives approximately 55 inches of total precipitation annually, based on records collected near London Springs between 1961 and 1990 (OCS 1998). The 2-year 24-hour rainfall event for the site area is 0.30 inches (USDC 1973). The site is not situated in either the 100- or 500-year floodplains (FEMA 1985).

7.2.2 Summary of Targets

No recorded surface water rights currently exist on Dennis Creek, Garoutte Creek, the Coast Fork of the Willamette River, or Cottage Grove Reservoir are within the site's 15-mile TDL (OWRD 1999).

Dennis Creek does not support any fish populations; however, Garoutte Creek supports a population of Cutthroat trout. Fishing activity on Garoutte Creek occurs in the area of its confluence with Dennis Creek and downstream into the Coast Fork of the Willamette River (Hagedorn 1998). Harvest statistics are not available for Garoutte Creek or the Coast Fork of the Willamette River. Cottage Grove Reservoir is a popular sport fishery; however, no harvest statistics are available (Hagedorn 1998).

According to the Oregon Natural Heritage Program (ONHP) site area is used by several species of potential concern (ONHP 1999). These species include the following:

- Oregon chub (state endangered species),
- Bald eagle (federal threatened species), and
- Northern spotted owl (federal threatened species).

The ONHP could not provide detailed locations for the habitats used by these species, however, ONHP staff indicated that their presence within 4 miles of the site is confirmed. No other sensitive environments are known to exist downstream of the site.

The nearest wetlands to the site are Palustrine Forested and Palustrine Emergent wetlands exist along the Coast Fork of the Willamette River, starting approximately 1.9 miles downstream of the site. These types of wetlands meet the definition of wetlands set forth in 40 CFR 230.3. Wetlands front the river for approximately 4.7 miles to Cottage Grove Reservoir (9.4 miles of total wetland frontage). Cottage Grove Reservoir is bordered by Palustrine Emergent wetlands in several locations, with wetland frontage of approximately 1.7 miles along the lake. No additional wetlands exist within the TDL along the Coast Fork of the Willamette River downstream of Cottage Grove Reservoir (NWI 1974).

7.2.3 Surface Water Pathway Sample Results

Analytical results of the surface water and sediment samples used to evaluate the overland flow/flood migration component are summarized below by surface water body. References to data summary tables for the analytical results are included in each of the subsections below.

- **Dennis Creek.** Five collocated surface water and sediment samples were collected from Dennis Creek (Figure 7-4). The background samples for the Dennis Creek samples are

recycled paper.

ecology and environment

98BBDC05SW (surface water) and 98BBDC05SD (sediment). Sample results for the Dennis Creek samples are included in Tables 7-3 (surface water) and 7-4 (sediment).

Inorganic elements which were detected at elevated concentrations in the Dennis Creek surface water samples include antimony ($1.1 \mu\text{g/L}$ at the mouth of Dennis Creek), chromium ($47 \mu\text{g/L}$ at the mouth of Dennis Creek), copper ($3.9 \mu\text{g/L}$ at the mouth of Dennis Creek), lead ($0.2 \mu\text{g/L}$ at two locations including the intermittent tributary confluence and a location downstream of the mine road), and nickel ($22 \mu\text{g/L}$ at the mouth of Dennis Creek). The elevated concentration of copper at the intermittent tributary was the only elevated concentration detected in surface water at a PPE.

Mercury was the only inorganic element detected at an elevated concentration in the Dennis Creek sediment samples. Mercury concentrations ranged from an adjusted concentration of 0.667 mg/kg at the intermittent tributary PPE to an adjusted concentration of 26.23 mg/kg at the PPE located below the "lower" tailings pile.

Garoutte Creek. Two collocated surface water and sediment samples were collected from Garoutte Creek (Figure 7-4). The background samples for the Garoutte Creek samples are 98BBGC02SW (surface water) and 98BBGC02SD (sediment). Sample results for the Garoutte Creek samples are included in Tables 7-3 (surface water) and 7-4 (sediment).

Inorganic elements which were detected at elevated concentrations in the Garoutte Creek surface water sample include: lead ($0.14 \mu\text{g/L}$), and nickel ($21 \mu\text{g/L}$).

No inorganic elements were detected at elevated concentrations in the Garoutte Creek sediment sample collected downstream of the confluence with Dennis Creek.

8. SUMMARY AND CONCLUSIONS

8.1 SUMMARY

In August 1998, START conducted an SI at the Black Butte Mine located near Cottage Grove, Oregon. The mine is a former mercury mine which operated between the 1890s and 1970s. The major site features currently at the site include tailings piles, a mill building which houses a rotary kiln and mercury condenser, an open mine adit, and old mine buildings and debris. The mine was operated by a series of different mining companies throughout the mine's operational years. The current owner of the mine property is the Land and Timber Company of Coos Bay, Oregon.

The mining operations included extraction of mercury-bearing ore from underground tunnels and on-site milling and processing of ore in a rotary kiln to obtain elemental mercury. Tailings from the milling process were deposited on site, downhill from the former mill locations toward Dennis Creek. Dennis Creek flows within 30 feet of the mine tailings pile; an estimated 300,000 cubic yards of tailings are present at the site.

The SI involved the collection of samples from potential hazardous substance sources at the mine and from target areas potentially impacted through contaminant migration from on-site sources. A total of 52 samples (excluding QC samples) were collected for the SI. Sample locations included multiple locations at the on-site sources, Dennis Creek, Garoutte Creek downstream of its confluence with Dennis Creek, and nearby springs and domestic wells used for drinking water. Samples were analyzed for TAL inorganic elements at EPA's Manchester Laboratory.

8.1.1 Source Summary

Sources identified for the SI at Black Butte Mine include the Mine Tailings, the former mill/rotary kiln, and the Mine Adit. All of the sources sampled for the SI contained at least one hazardous substance at significant concentrations. Mercury, found in only one sample, and arsenic detected in seven samples, were the only contaminants detected at significant concentrations in the mine tailings. The former mill/rotary kiln soils contain 10 contaminants at significant concentrations, most notably mercury, which ranged in concentration from 91.9 mg/kg to 54,300 mg/kg, and arsenic which ranged in concentration from 114 mg/kg to 952 mg/kg. The Mine Adit water and sediments contain 9 contaminants at significant concentrations.

8.1.2 Migration Pathways and Targets Summary

Results of the SI indicate that migration of site-related contaminants has occurred. Groundwater samples collected from nearby springs and domestic wells contained elevated concentrations of inorganic elements that were also detected at significant concentrations in the on-site sources. Arsenic was detected above federal MCLs for drinking water in three of the domestic wells sampled for the SI. Mercury was not detected in any of the domestic well samples.

The red-colored mine tailings were observed in the stream channel of Dennis Creek during the SI field work. Although the surface water sample results from Dennis Creek and Garoutte Creek do not strongly indicate a release of contaminants to the water column, the migration of contaminants from tailings to the creek was confirmed by elevated concentrations of mercury in two sediment samples collected downstream of the "lower" tailings pile. However, no elevated contaminant concentrations in sediment were observed farther downstream in Garoutte Creek that can be attributed to releases from the mine sources. No sensitive environments or food chain targets exist in Dennis Creek; however, Garoutte Creek supports a small sport fishery (Cutthroat trout). Wetlands occur downstream of Garoutte Creek in the Coast Fork of the Willamette River, and the site area is known habitat for several endangered and threatened species.

8.2 CONCLUSIONS

CERCLA-regulated inorganic elements were detected in all of the on-site sources at Black Butte Mine. Releases of these contaminants may have occurred through groundwater migration and through runoff to a nearby creek. Water wells in the site vicinity contained seven inorganic elements at elevated concentrations, but mercury was not detected in any of the well samples. Arsenic concentrations in three well samples exceeded the MCL. The SI determined that elevated concentrations of mercury are present in creek sediments up to several hundred feet downstream of the mine tailings located at the site. No targets exist in the areas where elevated levels of contaminants were detected; however, a sport fishery and wetlands exist downstream of contaminated areas.

SUBJ: Inorganic Data Quality Assurance Summary Check, Black Butte Mine Site,
Cottage Grove, Oregon

REF: TDD: 98-04-0004 PAN: CD0401SIDM

The data quality assurance summary check of 33 soil/sediment samples collected from the Black Butte Mine site located near Cottage Grove, Oregon, has been completed. Total Metals analyses (EPA CLP SOW Method ILMO4.0) was performed at the Manchester Environmental Laboratory, Port Orchard, Washington.

The following discrepancies were noted:

The review memorandum lists the analysis method as EPA CLP SOW ILMO4.0 while the data sheets list method ILM3.0. The original data reviewer stated that the correct method is ILMO4.0 and that the data sheets are incorrect due to software inconsistencies.

The review memorandum lists several mercury results to be qualified as estimated quantities (J) while the data sheets only list the laboratory qualifier (N). The original data reviewer stated that the qualifiers are equivalent. The secondary reviewer applied the (J) qualifiers as listed in the memorandum.

The review memorandum states that all selenium results should be qualified as estimated quantities (J); the selenium result in sample 98364149 was inadvertently unqualified. The secondary reviewer added the (J) qualifier to sample 98364149 as listed in the memorandum.

The following additional qualifiers were applied when necessary to indicate potential bias of estimated quantities :

L - Low Bias

H - High Bias

K - Unknown Bias

December 16, 1998

For ICP-AES and GFAAS analyses, the samples were grouped into two sets, set 1 included samples 98364122 through 98364141 while set 2 included samples 98364142 through 98364154.

Data Qualifications

The following comments refer to the ESAT performance in meeting quality control specifications outlined in the *CLP Statement of Work (CLP-SOW) for Inorganic Analysis, rev. ILMO4.0, the Manchester Environmental Laboratory Quality Assurance Manual, rev. 5/88*, and the QA plan. The recommendations presented herein are based on the information provided for the review.

1.0 Timeliness -

The technical (40 CFR part 136) holding time from the date of collection for metals in water is 180 days (28 days for mercury). The samples were collected between 09/01/98 and 09/03/98. CVAAS (mercury) analyses were completed on 10/01/98. Samples 98364122, 98364123, and 98364124 were analyzed 2 days outside the mercury holding time. Samples 98364125, 98364126, 98364127, and 98364128 were analyzed 1 day outside the mercury holding time. Since these sample results were qualified based on matrix spike recovery and since the holding time was just exceeded, no further qualification was made based on holding time.

ICP-AES and GFAAS analyses were completed on 011/16/98. No qualification was made on this basis.

2.0 Sample Preparation - Acceptable

The samples were prepped for ICP-AES and GFAAS analyses on 09/25/98 (ICP/GFAAS set 1) and 09/29/98 (ICP/GFAAS set 2). All sample preparation was in accordance with Manchester Laboratory protocols.

The samples were prepped for CVAAS analyses using both 'wet' and 'dry' sample preparation procedures on 09/21/98, 09/28/98, and 09/30/98. All mercury sample preparation was in accordance with Manchester Laboratory protocols. No qualification was made based on sample preparation.

Note, the 'dry' sample preparations were done in attempt to reduce matrix homogeneity problems. For the 'dry' preparations, samples were grouped together based on percent solids and estimated sample concentrations. Sample 98364154 was relatively 'dry' to begin with (90% solids) but the difference between the 'wet' and 'dry' results was so great, mercury in this sample was qualified 'J', estimated.

3.0 Calibrations - Acceptable

The samples were analyzed by ICP-AES (Inductively Coupled Plasma - Atomic Emission Spec) on 10/16/98 (set 1), 10/20/98 (set 2), and

11/09/98 (dilution analyses for aluminum for set 1 samples 98364129 and 98364140). ICP-AES elements included Ag, Al, As, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, K, Mg, Mn, Na, Ni, Pb, Sb, V, and Zn. The instrument was standardized the day of analysis according to the analytical method using one blank and a single calibration standard for each element. All ICP calibrations were performed as required and met the acceptance criteria; therefore, no qualification was made on this basis.

Samples were analyzed by GFAAS (Graphite Furnace Atomic Absorption Spec) between 10/16/98 and 11/16/98 for arsenic, lead, selenium, and thallium. The instrument was standardized the day of analysis according to the analytical method using one blank and at least 3 standards. The calibration curves were linear and had correlation coefficients greater than 0.995. No qualification was made based on the GFAAS calibration.

The samples were analyzed by CVAAS (mercury) on 09/22/98, and 09/23/98 (using the initial 'wet' prep - only sample sets 1&2 were reported). Sample sets 3 & 4 were re-prepared and re-analyzed on 09/29/98 (only the first dry prep on sample set 3 was reported). Sample set 4 was analyzed on 10/01/98 (second dry prep analyzed and plus the first dry prep for sample 98364154 was analyzed and reported). The instrument was calibrated according to the analytical method with a matrix blank and five standards with the exception of the analysis on 10/01/98 which had a matrix blank and four standards. The calibration curves were linear and all had correlation coefficients greater than 0.995. No qualification was made based on the mercury calibrations.

4.0 Reference Control Samples/Calibration Verification -

Calibration verification samples are required before and after sample analysis and after every 10 samples during analysis. Metals recoveries must be within 90-110% (80-120% for mercury).

All ICP-AES, GFAAS, and CVAAS calibration verification samples met the frequency and recovery criteria; therefore no qualification was made based on ICP-AES, GFAAS, or CVAAS calibration verification.

Reference control samples were digested and analyzed along with the samples to verify the efficiency of laboratory procedures. Acceptance control limits of recovery for metals analyses are 80-120%. In addition, a solid reference control sample was digested and analyzed via ICP-AES and CVAAS. All recoveries met the acceptance criteria for reference control samples except for silver in the solid reference control sample for silver in both sets of ICP-AES samples (indicating low bias in the results). All silver results were qualified 'J', estimated due to solid reference control sample results.

5.0 Blanks -

A procedural blank was prepared with each set of samples to show

December 16, 1998

potential contamination from the analytical procedure. If an analyte was found in the associated blank, the sample results were qualified if the analyte concentration was less than five times the analytical value in the blank.

Calcium, iron, sodium, and antimony were detected in one or both of the ICP-AES preparation blanks. Arsenic and antimony with negative values greater than the IDL were detected in calibration blanks for ICP-AES. Based on blank contamination, associated sample results were qualified as follows: Sodium in samples 98364145 and 98364137 was qualified 'U', antimony in samples 98364132, 98364133, 98364137, and 98364141 was qualified 'J'.

Mercury was detected in the preparation blank however, all associated mercury results were greater than five times this blank level; therefore no mercury results were qualified on this basis.

6.0 ICP-AES Interference Check Sample -

The interference check sample (ICS) is analyzed by ICP-AES to verify interelement and background correction factors. Analysis is required at the beginning and end of each sample analysis run and recoveries must be between 80% and 120%. All ICS recoveries were within the recovery criterion. No qualification was made based on ICS analyses.

The samples' raw data was checked. Most of the samples had high concentrations of iron and some samples had high concentrations of aluminum. ICS-A results, sample results and theoretical analyte concentration equivalents arising from interferents (aluminum and iron in Table 2 of ILMO4.0) were checked and evaluated. Since for these sample sets, ICS-A interferents were analyzed at a lower concentration than recommended by ILMO4.0, insufficient information about interference due to aluminum and iron was obtained. Using professional judgement, the sample results were qualified as follows due to suspected aluminum and iron interference: any analyte less than 10 times the IDL that is interfered with by iron and/or aluminum was qualified 'UJ', estimated detection limit if iron was ≥ 100 mg/L and/or if aluminum was ≥ 250 mg/L in the sample.

All detected antimony results for sample set 2 and antimony in samples 98364132, 98364133, 98364137, and 98364141 was qualified 'UJ'.

Cadmium in samples 98364129 and 98364131 was qualified 'UJ'.

Other affected analytes were either 10 times above the detection limit or were reported via GFAAS and therefore were not qualified based on suspected interference.

7.0 Duplicate Analysis - Acceptable

Duplicate analysis was performed on samples 98364125 (sample set 1) and 98364151 (sample set 2) for ICP-AES and GFAAS analyses. All

results above the required detection limit were within the $\pm 35\%$ RPD soil criterion. No qualification was made based on duplicate analysis.

Duplicate analysis was performed on samples 98364135 (sample sets 1&2), 98364151 (sample set 3), and 98364125 (sample set 4) for CVAAS analyses. All reported results above the required detection limit were within the $\pm 35\%$ RPD soil criterion. No qualification was made based on duplicate analysis.

8.0 Field Duplicate Analysis - Not Applicable

Field duplicate analysis was not indicated in the field collection documentation.

9.0 Matrix Spike/Matrix Spike Duplicate Analysis -

Matrix spike sample analyses are done to provide information about the effect of the sample matrix on measurement methods. Matrix spike recovery must be within the limits of 75 - 125% for un-spiked sample results less than four times the spike amount.

Matrix Spike analysis was performed on samples 98364125 (sample set 1) and 98364151 (sample set 2) for ICP-AES and GFAAS analyses. All matrix spike analyses were within the acceptance criteria; with the exception of antimony (19.1% and 12.3% for set 1, 34.8% and 44.9% for set 2), copper (67.8% on one of the spikes for set 2), selenium (72% for both spikes for set 1, 49% and 54% for set 2), thallium (59% and 58% for set 1, 3% and 1% for set 2), and zinc (70.7% for one of the spikes for set 2). No copper or zinc results were qualified based on matrix spike recovery as the average spike recovery for each sample set was $>75\%$.

Undetected antimony was qualified 'R', in sample set 1 due to the extremely low matrix spike recovery. All sample set 2 antimony results and any detected antimony results for sample set 1 were qualified 'J', estimated (low bias for samples 98364147 and 98364154, unknown bias for the other samples as they were also qualified based on suspected iron and/or aluminum interference and in some cases negative blank contamination).

All selenium results were qualified 'J', estimated (low bias suspected) due to matrix spike recovery.

Thallium was undetected in all sample set 2 samples and was qualified 'R', unuseable due to the extremely low matrix spike recovery. All sample set 1 thallium results were qualified 'J', estimated (low bias suspected) due to matrix spike recovery.

Matrix Spike and Matrix Spike Duplicate analyses were performed on samples 98364135 (mercury sample sets 1&2), 98364151 (mercury sample set 3), and 98364125 (mercury sample set 4) for CVAAS analyses. All

reported results with un-spiked sample results less than four times the spike amount were within the acceptance criteria with the exception of mercury for sample set 4 (177% & 156%). Mercury in sample set 4 samples was qualified 'J', estimated due to matrix spike recovery (high bias suspected).

10.0 Graphite Furnace Atomic Absorption Spec (GFAAS) QC -

GFAAS requires duplicate injections and an analytical post spike analysis for each sample. Duplicate injections must be within 20% RSD if the analyte concentration is greater than the practical quantitation limit. Post spike recovery must be within 85 - 115%.

All duplicate injections and post spike recoveries were within the specified criteria; with the exception of the post spike recovery for arsenic for sample 98364153 (82%), and for numerous selenium and thallium results (generally low post spike recoveries). Arsenic in sample 98364153 was qualified 'J', estimated due to the post spike recovery. Selenium and thallium results were already qualified due to matrix spike recovery and therefore required no further qualification.

11.0 ICP-AES Serial Dilution - Acceptable

Samples 98364129 (sample set 1) and 98364145 was analyzed by ICP-AES by serial dilution to check for potential interferences. All analytes which exceeded the minimum concentration criterion (50 times the IDL) agreed within 10% RPD. No qualification was made on this basis.

The un-diluted iron result for sample 98364145 and the un-diluted manganese result for sample 98364129 were above the linear range of the instrument. Since the serial dilution results were in agreement with the reported, un-diluted results, no action was taken.

12.0 Detection Limits - Acceptable

Sample results which fall below the instrument detection limit (IDL) are assigned the value of the instrument detection limit and the 'U' qualifier is attached.

Practical Quantitation Limit (PQL) samples are required to demonstrate a linear calibration curve near the PQL. PQL standards were run at the required frequency with the exception of the 11/13/98 thallium analysis - the initial PQL sample was not run before samples, however the final PQL sample was run. There is no current functional guidelines criteria for PQL recovery, therefore no data was qualified based on PQL recovery.

13.0 Overall Assessment of the Data

This validation of the data is based on the criteria outlined in the National Functional Guidelines for Inorganic Data Review (02/94).

Approximately 19% of the data was qualified due to suspected sample non-homogeneity, reference control sample results, blank contamination, suspected interference, matrix spike recovery, or GFAAS post spike recovery. The data as qualified is acceptable for all purposes.

Below are the definitions for the National Functional Guidelines for Inorganic Data Review (02/94) qualifiers used when validating/ qualifying data from Inorganic analysis.

DATA QUALIFIERS

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

Report by Parameter for Project TEC-723A

Project Code: TEC-723A
 Project Name: BLACK BUTTE MINE
 Project Officer: MARK ADER
 Account Code: 98T10PFAX10ZZLA00
 Station Description: 98 BB MK02 SS

Collected: 9/2/98
 Matrix: Solid
 Sample Number: 98364143
 Type: Reg sample

		Result	Units	Qlfr
MET				
Parameter : Lead by AA, RAS				
Method : 200.9	Graphite Furnace Atomic Absorption Spectroscopy, EMSL-CIN			
Prep Method: ILM04.0				
Analytes : 7439921	Lead	17.2	mg/kg	
Parameter : Selenium by AA, RAS				
Method : 200.9	Graphite Furnace Atomic Absorption Spectroscopy, EMSL-CIN			
Prep Method: ILM04.0				
Analytes : 7782492	Selenium	0.40	mg/kg	UJ L
Parameter : Thallium by AA, RAS				
Method : 200.9	Graphite Furnace Atomic Absorption Spectroscopy, EMSL-CIN			
Prep Method: ILM04.0				
Analytes : 7440280	Thallium			R
Parameter : Metals, ICP-SAS				
Method : 200.7-M	Inductively Coupled Plasma-Atomic Emission Spectrometry, CLP ILM3.0			
Prep Method: ILM04.0				
Analytes : 7429905	Aluminum	3420	mg/kg	
7440360	Antimony	25.6	mg/kg	UJ K
7440382	Arsenic	145	mg/kg	
7440393	Barium	10.3	mg/kg	
7440417	Beryllium	0.594	mg/kg	
7440439	Cadmium	0.37	mg/kg	
7440702	Calcium	2390	mg/kg	
7440473	Chromium	44.3	mg/kg	
7440484	Cobalt	24.5	mg/kg	
7440508	Copper	137	mg/kg	
7439896	Iron	54400	mg/kg	
7439921	Lead	17.9	mg/kg	
7439954	Magnesium	1200	mg/kg	
7439965	Manganese	1190	mg/kg	
7440020	Nickel	34.5	mg/kg	
7440097	Potassium	70	mg/kg	U
7440224	Silver	0.40	mg/kg	UJ L
7440235	Sodium	25.9	mg/kg	
7440622	Vanadium	92.7	mg/kg	
7440666	Zinc	1170	mg/kg

MEMORANDUM

DATE: February 10, 1999

TO: Bill Richards, Project Manager, E & E, Seattle, WA

FROM: Mark Woodke, START-Chemist, E & E, Seattle, WA *MW*

SUBJ: Inorganic Data Quality Assurance Summary Check, Black Butte Mine Site,
Cottage Grove, Oregon

REF: TDD: 98-04-0004 PAN: CD0401SIDM

The data quality assurance summary check of 21 water samples collected from the Black Butte Mine site located near Cottage Grove, Oregon, has been completed. Target Analyte List (TAL) Metals analyses (EPA CLP SOW Method ILMO4.0) was performed at the Manchester Environmental Laboratory, Port Orchard, Washington.

The following discrepancies were noted:

The review memorandum lists the analysis method as EPA CLP SOW ILMO4.0 while the data sheets list method ILM3.0. The original data reviewer stated that the correct method is ILMO4.0 and that the data sheets are incorrect due to software inconsistencies. No action was taken based on this discrepancy.

Several samples had two listed results for lead; revised sample results were received from the laboratory on February 5, 1999.

Combined Final Report for Project TEC-723A

Project Code: TEC-723A
Project Name: BLACK BUTTE MINE
Project Officer: MARK ADER
Account Code: 98T10PFAX10ZZLA00
Station Description: 98 BB GC01 SW

Collected: 9/1/98
Matrix: Liquid-Total
Sample Number: 98364113
Type: Reg sample

		Result	Units	Qlfr
MET				
Parameter	All MERCURY tests			
Method	245.1	Cold vapor mercury in water		
Prep Method:	245.1	Determination of Mercury in Water by Col		
Analytes	7439976	Mercury	0.20	ug/L
				U
Parameter	Metals, ICP-SAS			
Method	200.7-M	Inductively Coupled Plasma-Atomic Emission Spectrometry, CLP ILM3.0		
Prep Method:	200.8 MOD			
Analytes	7429905	Aluminum	186	ug/L
	7440393	Barium	8.56	ug/L
	7440417	Beryllium	1.3	ug/L
	7440439	Cadmium	2.5	ug/L
	7440702	Calcium	13300	ug/L
	7440473	Chromium	33.1	ug/L
	7440484	Cobalt	6.3	ug/L
	7440508	Copper	3.8	ug/L
	7439896	Iron	332	ug/L
	7439954	Magnesium	2930	ug/L
	7439965	Manganese	16.3	ug/L
	7440020	Nickel	21	ug/L
	7440097	Potassium	880	ug/L
	7440235	Sodium	5090	ug/L
	7440622	Vanadium	3.8	ug/L
	7440666	Zinc	5.0	ug/L
				U
Parameter	Metals, ICP/MS			
Method	200.8 MOD			
Prep Method:	200.8 MOD			
Analytes	7440360	Antimony	0.63	ug/L
	7440382	Arsenic	2.4	ug/L
	7439921	Lead	0.14	ug/L
	7782492	Selenium	1.3	ug/L
	7440224	Silver	0.037	ug/L
	7440280	Thallium	0.63	ug/L
